

## Dying by design: reimagining the end of life in health systems and communities

Ken Rosenfeld, MD  
Section Chief, Palliative Care  
UH-Cleveland Medical Center  
Hospice of Western Reserve Annual Conference  
September 14, 2017

## End-of-life is the new black . . .

## Health care near the end of life: the design-oriented reality

“Every system is perfectly designed to achieve the results it achieves.”  
Paul Bataldan

### Objectives of today’s conversation:

- Describe the evolution of health care near the end of life, from a system perspective
- Propose a re-design of advanced illness care using population health principles
- Introduce how community-driven innovation may help transform the end of life experience

### What results are we trying to achieve?

- Shape care in a way that honors a person’s values, preferences, and life story
- Avoid premature dying
- Avoid preventable suffering
  - Physical pain and other symptoms
  - Emotional and spiritual distress
- Support positive developmental goals
  - Enhance personhood as death approaches
- Aid caregivers’ well-being and adjustment during the process, and afterwards
- Enhance supports and connections within communities

### The transformation of dying in the US

	<u>1900</u>	<u>2000</u>
Age at death	46 years	78 years
Top Causes	Infection Accident Childbirth	Cancer Organ system failure Stroke/Dementia
Disability	Not much	2-4 yrs before death
Financing	Private, modest	Insurance, FFS 27% of Medicare \$\$
Context freely	Primarily at home Few tx available ICUs absent	Primarily institutional Interventions used ICU care common

- ### Response to the changing experience of EOL
- 1973 – hospice introduced in the US
  - Autonomy-oriented model of EOL embraced
    - 1980s-1990s – growing interest in advance directive design
    - 1990 – Patient Self-Determination Act (PSDA)
    - 1994 – first physician-assisted suicide law approved
    - 1995 – first POLST form introduced in OR
    - 1995 – SUPPORT study published

### A history of EOL design: SUPPORT

- RCT of an intervention to improve EOL care
- 1989-1994, 5 large U.S. hospitals
- 9105 pts, 9 life-threatening diagnoses
- 6 mo. mortality = 47%
- Nurse-led intervention

**Original Contributions**

**A Controlled Trial to Improve Care for Seriously Ill Hospitalized Patients**  
 The Study to Understand Prognoses and Preferences for Outcomes and Risks of Treatments (SUPPORT)

The SUPPORT Principal Investigators

**Objectives**—To improve end-of-life decision making and reduce the frequency of mechanically ventilated, sedated, and paralytically paralyzed dying.

**Design**—A 2-year prospective observational study (phase I) with 9105 patients followed for a 2-year period (phase II) in 5 large U.S. hospitals and 5 large academic centers included in a control group (the intervention group [I-PRO] or control group [C-PRO]).

**Setting**—Five teaching hospitals in the United States.

**Patients**—A total of 9105 adults hospitalized with one or more of nine life-threatening diagnoses are used to describe mortality rate of 47%.

**Interventions**—Physicians in the intervention group received education of the physician of death, and the study group received education of the physician, nurse, and family member (CPR), and a written decision aid (WDA) to guide decision making. The study group received education of the physician, nurse, and family member (CPR), and a written decision aid (WDA) to guide decision making. The study group received education of the physician, nurse, and family member (CPR), and a written decision aid (WDA) to guide decision making. The study group received education of the physician, nurse, and family member (CPR), and a written decision aid (WDA) to guide decision making.

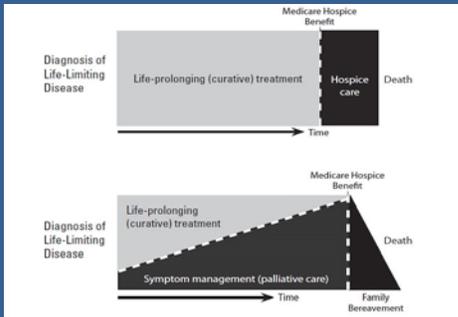

**Results**—The primary outcome was the proportion of patients who were not intubated and paralyzed. The proportion of patients who were not intubated and paralyzed was significantly higher in the intervention group than in the control group. The proportion of patients who were not intubated and paralyzed was significantly higher in the intervention group than in the control group.

The SUPPORT Investigators. JAMA 1995;274:1591-1598

- ### SUPPORT -- Results
- 47% of MDs knew their pts. did not want CPR
  - 38% of patients who died spent ≥10 days in ICU
  - 50% of patients who died had moderate or severe pain for most of their last 3 days of life
  - Intervention designed to improve care had no impact on any primary outcome measure

- ### The SUPPORT legacy: making sense of the advanced illness experience
- Patients misunderstand their condition, prognosis, and the effectiveness and burdens of treatments
  - MDs are poor judges of pt prognosis
  - MDs do not know pt values/preferences
  - Physicians/hospital culture drive decision making
  - Pt/family decision making driven by factors other than tx benefits/burdens/tradeoffs, and is not driven by a simple autonomy model
  - Society and health systems are pathologically death-avoidant

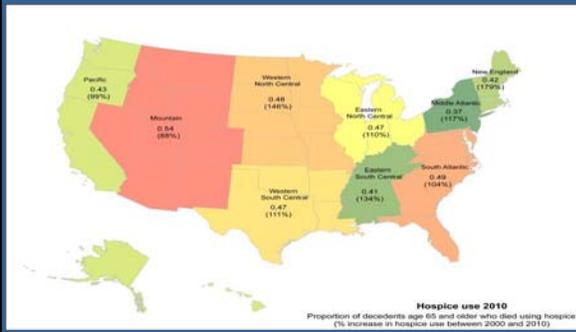

### The system response to SUPPORT: the palliative care model

### The growth of palliative care and hospice

- Palliative care programs
  - Increase from 25% to 63% of US hospitals 2000-2009
  - Palliative care consultation teams > PC units
  - Shown to improve quality/satisfaction, reduce costs
  - Referral-based, generally late in the illness course
  - Mostly hospital-based: inpatient, episodic, discontinuous
- Hospice
  - Home > nursing facility-based
  - Better pain mgmt, emotional support, overall quality (Teno)
  - “Terrible choice” of comfort vs disease-directed care
  - Occurs very late in illness course -- >1/3 in last week

### Change in hospice use 2000-2010

Aldridge MD, et al. *Med Care*. 2015 Jan; 53(1): 95–101.

### Medicare EOL outcomes 2000-2009

	2000	2005	2009
No. of decedents	270 202	291 819	286 282
Deaths in acute care hospitals, % (95% CI)	32.6 (32.4-32.8)	26.9 (26.7-27.1)	24.6 (24.5-24.8)
ICU use in last month of life, % (95% CI)	24.3 (24.1-24.5)	26.3 (26.1-26.5)	29.2 (29.0-29.3)
Hospice use at time of death, % (95% CI)	21.6 (21.4-21.7)	32.3 (32.1-32.5)	42.2 (42.0-42.4)
Health care transitions in last 90 d of life per decedent, mean (median) (IQR)	2.1 (1.0) (0-3.0)	2.8 (2.0) (1.0-4.0)	3.1 (2.0) (1.0-5.0)
Health care transitions in last 3 days of life, % (95% CI)	10.3 (10.1-10.4)	12.4 (12.3-12.5)	14.2 (14.0-14.3)

Teno JM, et al. *JAMA*. 2013 February 6; 309(5): 470–477

### Medicare EOL outcomes 2000-2009

	2000	2005	2009
No. of decedents	270 202	291 819	286 282
Deaths in acute care hospitals, % (95% CI)	32.6 (32.4-32.8)	26.9 (26.7-27.1)	24.6 (24.5-24.8)
ICU use in last month of life, % (95% CI)	24.3 (24.1-24.5)	26.3 (26.1-26.5)	29.2 (29.0-29.3)
Hospice use at time of death, % (95% CI)	21.6 (21.4-21.7)	32.3 (32.1-32.5)	42.2 (42.0-42.4)
Health care transitions in last 90 d of life per decedent, mean (median) (IQR)	2.1 (1.0) (0-3.0)	2.8 (2.0) (1.0-4.0)	3.1 (2.0) (1.0-5.0)
Health care transitions in last 3 days of life, % (95% CI)	10.3 (10.1-10.4)	12.4 (12.3-12.5)	14.2 (14.0-14.3)

Teno JM, et al. *JAMA*. 2013 February 6; 309(5): 470–477

### Next steps in palliative care design: population health

DIMENSION	CURRENT MODEL	POPULATION HEALTH MODEL
How cases are identified	Referral-based	Proactive case-finding
Focus of performance measurement	“Numerator” of who is referred	Both “numerator” and “denominator” (population in need)
Paradigm of care	Biomedical; physiology-driven	Biopsychosocial; physiology and person/family-driven
Primary location of care	Hospital-centered	Community-centered
Pattern of care delivery	Episodic, fragmented	Registry-based, coordinated
Financing	Revenue-driven	Revenue and cost avoidance-driven
Workforce development	Staffing to referral demand and reimbursement	Staffing guided by population-at-risk and need intensity

### Population health-based advanced illness care: core elements

- Patient population – all patients with debilitating chronic or life-limiting illness
- Timing – ideally from time of diagnosis thru death and bereavement
- Systems and processes that support:
  - Comprehensive person/family-centered care – individualized, goal-based
  - Concurrent with disease-directed care
  - Coordination and continuity across venues/providers
- PC and hospice intertwined and fluid

Natl Consensus Project, Clinical Practice Guidelines for Quality PC

### NEJM lead articles

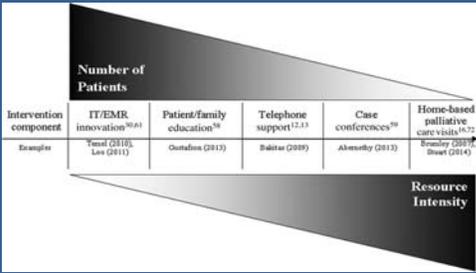

Proactive, collaborative PC:

- Improved HRQOL
- Reduced depression sx
- Improved satisfaction
- Earlier hospice transition
- Reduced costs of care
- Survival was 2.7 months LONGER

### Population health and palliative care: intervention trials

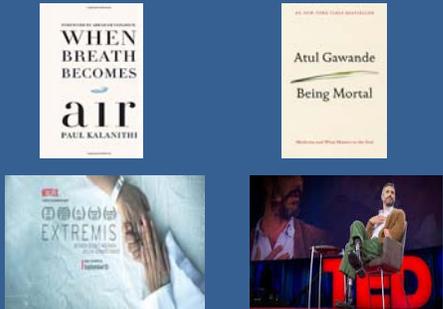

Intervention component	IT/EMR innovation <sup>50,51</sup>	Patient/family education <sup>52</sup>	Telephone support <sup>53,55</sup>	Case conferences <sup>59</sup>	Home-based palliative care visits <sup>60,77</sup>
Examples	Tennant (2011); Lave (2011)	Ostafson (2011)	Baltes (2009)	Akenshby (2011)	Ernst (2011); Stewart (2014)

Smith G. *J Palliat Med*. 2015 Jun;18(6):486-94

### Improving EOL from the outside: community-driven transformation

- Why communities should drive change
  - Most of the EOL experience occurs outside of hospitals
  - Health care system is not incentivized to drive better EOL
  - Health care will shift when patients/families/communities demand person-centeredness
- Components
  - Transforming community consciousness
  - Community-based innovation
  - Community activation and engagement

**Let's get it right.**

## Re-designing EOL: the OpenIDEO End of Life Challenge

**CHALLENGE**  
How might we reimagine the end-of-life experience for ourselves and our loved ones?

PARTICIPATE IN IMPACT

## OpenIDEO End of Life Challenge

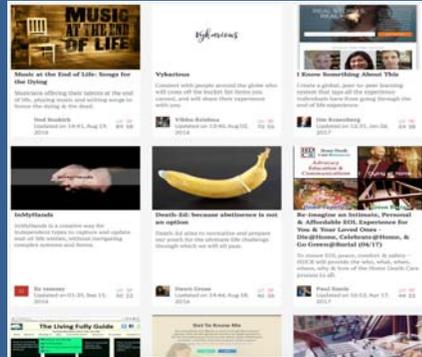

### THE CHALLENGE PROCESS

We tackle each social issue via a challenge, a three to five month collaborative process that focuses our attention on the topic and creates a space for community members to contribute and build off each other. This approach is modeled on IDEO's *design thinking* methodology.

- **RESEARCH:** It all starts with an invitation for you and others around the world to share inspirations, stories, tools and successful examples on the challenge topic.
- **IDEAS:** Based on learnings from the Research phase, the OpenIDEO community shares new, wild or existing ideas and collaboratively refines them.
- **REFINEMENT:** We then focus on testing ideas with end users.
- **FEEDBACK:** This is when the OpenIDEO community shares comments and suggestions for next steps.
- **TOP IDEAS:** Working closely with the challenge sponsor, the OpenIDEO team chooses a set of top ideas based on their potential for impact, level of engagement and relevance to the challenge topic and evaluation criteria.
- **IMPACT:** This is where you can share learnings, find collaborators and share updates on how ideas are evolving.

## OpenIDEO End of Life Challenge: Top Ideas

## Community activation and engagement

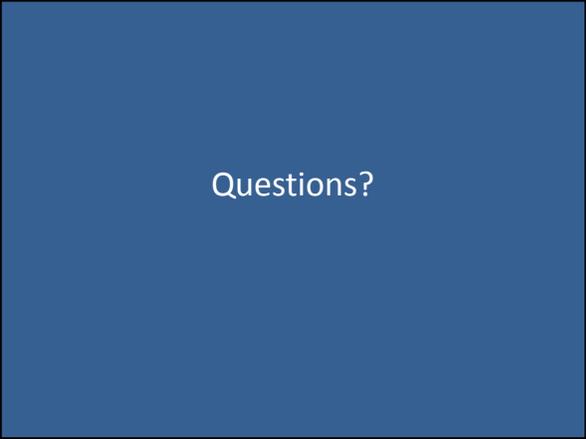

# Re:Imagine / End of Life

A citywide conversation about living and dying through art, experience, and

## Conclusion: can we re-design dying?

- Clear societal demand for a better EOL experience
- Health care has an integral role to that experience
  - But, "it's complicated"
- Communities have the potential to drive transformation

Questions?
